

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

- 1.-4. (Withdrawn)
5. (Currently amended) A method ~~Method~~ for setting up an air-borne hall, comprising the following steps:
- a) providing a housing rail (1);
 - b) providing a filler section (2);
 - c) providing an air-borne hall having an inner surface, an outer surface, and a cover rim;
 - e) d) arranging at least one fabric rim (3) of at least one fabric between said housing rail (1) and said filler section (2);
 - d) e) inserting said at least one fabric rim (2) and said filler section (2) into said housing rail (1);
 - e) f) rolling up said fabric rim (3) fixed on one side by said filler section (2) together with a cover rim (16) of the said air-borne hall facing towards the ~~inside~~ inner surface of said air-borne hall employing a sealing material (17) to form a bead (20),
wherein said filler section is deformed when inserted into said housing section so as to provide pressure on the at least one fabric against the housing section.
6. (Currently amended) A housing ~~Housing~~ rail for a filler section, comprising ~~with~~ a rib and two arms which are positioned opposite to each other and extend perpendicularly from the rib, wherein said rib and said two arms form a U-shape, each of said arms

having an end portion and a centre portion, wherein the distance between said two end portions is shorter than that between said two centre portions, wherein the rail receives a deformable filler section, wherein the deformable filler section is deformed when inserted in the rail so as to retain a fabric between the rib and the two arms and the deformable filler section.

~~characterized in that~~

~~said rib has a recess designed in such a way that upon insertion of said filler section a cavity (25) is formed between said filler section (2) and said housing rail (1) which is wider than the recess of said rib.~~

7. (New) A device for fixing at least one flexible fabric, comprising:

a housing rail having a U-shaped cross section and two arms running in parallel, said two arms each exhibiting a bead at one end of the inner surface of said U-shaped cross section, the U-shaped cross section defining an opening formed by the two arms and the bead; and

a deformable filler section, said deformable filler section sized slightly larger than the opening of said housing rail such that when said deformable filler section is placed inside of said U-shaped cross section of said housing rail, said deformable filler section deforms to releasably grip a flexible fabric against said inner surface of said U-shaped cross section of said housing rail.

8. (New) A device according to claim 7, where said deformable filler section is temporarily deformable and resumes its original shape upon removal from said U-shaped cross section of said housing rail.

9. (New) A device according to claim 7, where said deformable filler section is deformable and permanently retains the shape said deformable filler section assumes upon insertion into said U-shaped cross section of said housing rail.

10. (New) A device according to claim 8, said housing rail additionally comprising one or a plurality of external ribs attached to said housing rail, said external ribs supporting said housing rail.

11. (New) A device according to claim 9, said housing rail additionally comprising one or a plurality of external ribs attached to said housing rail, said external ribs supporting said housing rail.
